

General Electric LR-65 & LR-83 Training Class

Proven Maintenance, Calibration and Operation Techniques

Leading electricity providers know it takes more than field technicians and a dispatch center to properly maintain critical power system assets that make up their transmission and distribution systems. To be effective, your team needs to acquire knowledge and product-specific skills to allow them to accurately troubleshoot and repair this equipment.

Recognizing the demand in the electric power industry for a structured program that teaches these critical skills, we developed a comprehensive series of LTC maintenance training courses. Two of the models on which we can help are the GE LR-65 and LR-83.

GE LR-83 Load Tap Changer Training Model

What We Cover

THE BASICS

- Theory of Tap Changer Operation
- Unit and Model Identification
- Differences between the LR-65 and LR-83
- Sequence of Operation
- Inspections
- Maintenance and Adjustments
- High Amp Vs. Low Amp
- Neutral Position and the Need for the Unit to Pass Through Neutral
- Parts Identification
- Replacement of Major Components
- Critical Measurements
- Oil Filling of Unit
- Troubleshooting

GE LR-65 Load Tap Changer

CRITICAL COMPONENTS

- Types of Reversing Switches
- Replacing Reversing (Transfer) Switch
- Dynamic Braking Adjustments
- Replacing Moving Contacts
- Disassembly of Finger Contacts
- Disassembly of Contact Carrier
- Replacing Current Carrying Contacts
- Disassembly of the Push Rod
- Replacement of Collector Rings

High Amp Reversing Switch for LR-83

Selector Switch for LR-83

Who Should Attend

Field service technicians, relay technicians, substation technicians and engineers with maintenance and testing responsibilities for utilities can benefit from this class as well as supervisors and others who have responsibility for the testing and maintenance performed by contractors.

Course Structure

Training courses can be held at one of our training centers, off-site at regional locations across the U.S./Canada or at a customer's site. For customer on-site training, our training team coordinates shipment of required training equipment and conducts courses at the customer's facility, eliminating the need for customer travel. All training models were once fully functioning in the field, totally refurbished for use in these classes.

Each student receives a course manual that is theirs to keep with easy-to-use field reference guides along with many pages of technical resources. Our staff has compiled the information from personal experience as well as from that of utility-recognized experts on specific makes and models. Our qualified instructors teach each course, providing many years of experience to properly train your maintenance team.

To be sure participants maximize their experience and hands-on learning, we limit class sizes to 15 students, whether at your site or at one of our training centers. If you have more than 15 potential students, special pricing can be arranged to accommodate two classes held in the same week on consecutive days.

Continued Development

Waukesha Training continuously develops course offerings to serve the industry. We also work closely with customers to develop specialized training courses to fit their internal development programs, including annual recertification programs.
